

### Exercise 1: Kullback-Leibler Divergence

- (a) You want to approximate the binomial distribution with  $n$  number of trials and probability  $p$  with a Gaussian distribution with mean  $\mu$  and variance  $\sigma^2$ . To find a suitable distribution you investigate the Kullback-Leibler divergence (KLD) in terms of the parameters  $\theta = (\mu, \sigma^2)^\top$ .
- (i) Write down the KLD for the given setup.
  - (ii) Derive the gradients with respect to  $\theta$ .
  - (iii) Is there an analytic solution for the optimal parameter setting? If yes, derive the corresponding solution. If no, give a short reasoning.
  - (iv) Independent of the previous exercise, state a numerical procedure to minimize the KLD.
- (b) Sample points according to the true distribution and visualize the KLD for different parameter settings of the Gaussian distribution (including the optimal one if available).
- (c) Create a surface plot with axes  $n$  and  $p$  and colour value equal to the KLD for the optimal normal distribution.
- (d) Based on the previous result,
- (i) how can the behaviour for varying  $p$  be explained?
  - (ii) how can the behaviour for varying  $n$  be explained?

### Exercise 2: The Convexity of KL Divergence

Let  $p$  and  $q$  be the PDFs of a pair of absolutely continuous distributions.

- (a) Prove that the KL divergence is convex in the pair  $(p, q)$ , i.e.,

$$D_{KL}(\lambda p_1 + (1 - \lambda)p_2 || \lambda q_1 + (1 - \lambda)q_2) \leq \lambda D_{KL}(p_1 || q_1) + (1 - \lambda)D_{KL}(p_2 || q_2), \quad (1)$$

where  $(p_1, q_1)$  and  $(p_2, q_2)$  are two pairs of distributions and  $0 \leq \lambda \leq 1$ .

*Hint:* you can use the log sum inequality, namely that  $(a_1 + a_2) \log \left( \frac{a_1 + a_2}{b_1 + b_2} \right) \leq a_1 \log \frac{a_1}{b_1} + a_2 \log \frac{a_2}{b_2}$  holds for  $a_1, a_2, b_1, b_2 \geq 0$ .
